

Lab Evaluation 1

For this evaluation, you will be using the HR database, which is an example database provided by Oracle. The schema of the database is given in the picture below.

You can create the database in MySQL by running the commands of this [file](#). Create the database and write queries for the following tasks.

Tasks:

1. Show all the departments with no employees.
2. Display the department name and the number of employees in each department, excluding the departments with no employees.
3. Find the name, job titles of employees and their corresponding department names.
4. List all departments and the number of employees in each, including departments with no employees.
5. Retrieve the name of each department and the highest-paid employee in that department.

6. Show all employees in the 'Asia' region excluding the employees in the country 'China'.
7. Show the difference between the salaries of managers and the average salary of all the non-manager employees of each department.
8. Which region has the highest number of employees?
9. Find the average salary of employees in each region.
10. Show the number of unique job_ids in each region.
